Additional comments for reviewers

- Reviewer B : He/she asks me to re-organize my paper by adding 2 sections : Materials and sections, and Results and discussion.

Of course this suggestion is highly comprehensible, but in this case I would have to change nearly everything in this paper. That was not my will since I thought about showing rapidly the acquired data with the methods used to get them.

The congress which was held in October 2016 in Torino, focused on methods and methodologies. Thus I dedicated my talk to the approach made by photons and electrons in the study of prehistoric caves in Dordogne.

So I carried on with this schedule in the written paper.

- Reviewer B asks for details about the methods : all the informations are available in referred papers.

- Reviewer B quotes some "typing errors" but I have not received any version with these errors mentioned or underlined somehow, so what shall I do ?

- Reviewer C : asks me for " A brief description of the mechanism responsible for the formation of these concentration layers would be helpful in the introduction chapter"

This is exactly what we are looking for. It is one of our topics, to understand the mechanism for the formation of these layers. Before that, we need to determine the chemical composition, what we did. Next step will be to interpret (next paper).

So I am afraid I can not add anything in the introduction as requested.

The other comments have been taken into account.
